[57]

ABSTRACT

A method and apparatus for updating an application to conform to unique requirements of a specific locale. The update involves language translation, graphic substitution, and interface element reorientation. For example, the text used in labels, titles, and messages depends upon the selected language. Its direction and orientation may affect the placement and orientation of a menu, menubar, title, scrollbar, or toolbar. Similarly, the selection of icons and other graphical symbols may be culturally dependent. Once localized, user interface elements are stored in a disk dictionary. A disk dictionary is an object that, when given a key, returns a value after reading it in from disk. This disk dictionary is managed by an object called an archive. An archive is responsible for putting together the individual user interface elements that make up a particular presentation.

(54) A method for generating localizable message catalogs for java-based applications

(57) A method for generating localizable message catalogs for Java-based applications is disclosed. Message catalogs that are automatically flagged for what needs to be manually translated are generated from a given Java source code file (46, 78), which can then be used for translation (Figure 5, 80). ListResourceBundle data structures that are compatible with Java's internationalization model are also generated from the message catalogs that were previously generated (82) and manually translated into desired local language(s) (64, 80). This provides a more efficient means of maintaining a language-specific version of Java software after it has been released.

[57] **ABSTRACT**

The present invention provides a system and process which has the advantages of shortening the time and cost required to create a new localized version of a software product by automating much of the language translation process; by providing tools to automate the modifications to the program being localized, thereby reducing the probability of creating errors in the localization process and providing some measure of consistency between subsequently localized new releases of the product, and between different locales. The system disclosed includes an environment and tools to develop software modules to create methods to display, enter or print various single and multi-byte character sets. Moreover the system disclosed provides a mechanism for an independent software developer to localize a software product, using only a binary copy of the target program and the localization tool kit for that product. This will permit the Software manufacturer to contract with developers in various countries to perform the product localization for their respective countries, minimizing risks by not having to provide the developers with a source code version of the portions of the product which do not require localization, and assuring rapid and consistent versions of the localized product through the use of the tool kit provided for that product. The invention provides a method and apparatus for creating a localized version of a target computer program product by first creating a binary version of the localized materials using the localization kit, and then using the localization kit to overlay this binary version of the localized materials onto a binary version of the target computer program product. The localization of certain locale data in the target computer program binary image is also facilitated. The localization kit also provides tools to test and verify the localized version of the target computer program product. The system disclosed also provides a framework wherein new localization tools can be easily incorporated into the overall process.

(54) Title: **MULTILINGUAL COMPONENTS FOR APPLICATION DEVELOPMENT PROVIDING LOCALE SENSITIVE AND CULTURALLY APPROPRIATE PRESENTATION OF DATA**

(57) Abstract

Multilingual components support both development and dynamic runtime selection of locales to automatically update the language and formatting requirements of presented or stored data. Each multilingual component stores information identifying a plurality of different locales that are supported by the multilingual component. During development, the applications developer selects a set of the locales that are to be supported at runtime by the multilingual component, and defines additional user interface and behavioral properties. The developer further specifies an initial one of the locales as the locale which defines the language and presentation formatting requirements for presenting data within the multilingual component. During runtime the developer selected locale is used to present user input (or statically defined) data in the language and format of the locale. If enabled, the user can select a different one of the supported locales, in which case the multilingual component automatically changes the language and formatting of the presented or stored data to that of the user selected locale. The multilingual components include various implementations, including visual components, such as a calendar, a date/time display, a numeric display, an edit display, and a currency display. Non-visual components include a locale component which stores language and formatting parameters for one or more locales, and a text string manipulation control.

(54) Title: INTERACTIVE AND AUTOMATIC PROCESSING OF TEXT TO IDENTIFY LANGUAGE BIAS

(57) Abstract

A system (10) that interactively and automatically processes text to identify language bias has a text input (20), a central processing unit (CPU) (30), a memory (40) for storing bias codes, a memory (50) for storing words and phrases related to bias, and output apparatus (60) for presenting text output to a user. A computer-readable storage medium device (25) contains databases including a first database (26) of words expressing bias and a second database (27) including at least one alternative expression for each of the words expressing bias. The first database (26) has a bias-type code associated with each of the words expressing bias. The computer-readable storage medium may also include a third database (28) including help messages and/or training messages for language-bias education. Each of the provided computer-readable storage medium devices may be limited to one bias type or may include several bias types in the same device.
